## D\*Clot® HD Rotational Thrombectomy System

High Speed • Low Torque  
Active Aspiration Function  
Solid Single-piece Tip Design

D\*Clot®

## D\*Clot® HD Rotational Thrombectomy System

The **D\*Clot® HD** is a fully disposable system that is ready to use.  
It is indicated for mechanical declotting of AV dialysis fistulae and grafts.

### High Speed • Low Torque

- Rotates at approximately 10,000 RPM, allowing for safe low torque operation.

### Active Aspiration Function • 6Fr Catheter Shaft

- Negative pressure aids in thrombus maceration by withdrawing and holding thrombus near the rotating tip.
- Catheter shaft provides maneuverability through tortuous anatomy and pushability to transverse thrombus.

### Reverse Function

- Allows tip to be pulled out of tight anatomy.

D\*Clot® HD tip

D\*Clot® HD

Leading Competitor

### 5mm Angled Stainless-steel Tip

- Wall-to-wall contact of vessels up to 10mm.
- Smaller surface area reduces clot rotation phenomenon, providing better maceration.
- Solid single-piece tip design with no plastic element to increase strength and avoid dislodgement.

### Two-piece Handle Design

- Increases tactile feel by separating the weight of the battery pack.

### Thrombus Maceration

- Rotating tip in combination with active aspiration function breaks down thrombus into small particles.\*
