

BiopSafe®

Your daily protection.

BiopSafe® is a revolutionary method of handling biopsies which helps protect medical personnel all over the world. The big challenge in hospitals and clinics is how to fixate the biopsy in formalin without exposure to spillage or vapor.

BiopSafe® solves this problem - A small container with formalin encapsulated in the lid. With a light press of the thumb, the formalin is released in a closed system covering the biopsy. The result is that no personnel are exposed to the content in either liquid or vapor.

Features:

- Formalin encapsulated in the lid
- Easy press of the thumb to operate
- No exposure of personnel

The vials come in two sizes: 20 ml and 60 ml.

The 20 ml is perfect for easy and fast fixation of a single biopsy. The 60 ml makes it easy to handle more biopsies at the same time. Place each biopsy in a cassette, and arrange the cassettes in the vial. Screw on the and release the formalin.

1. Twist off the lid

2. Place the biopsy in the vial

3. Twist on the lid and tighten

4. A press of the thumb and the formalin is released

5. The biopsy is submerged in the formalin

6. The biopsy is ready for safe transportation
